

Kyle Jussab | Gameplay Programmer

626-773-0821 | Los Angeles, California | kylejussab@gmail.com | kylejussab.com | linkedin.com/in/kylejussab

Skills

Languages & Frameworks: C++, C#, Python, GDScript, JavaScript

Gameplay & Engine: Unity, Godot, Gameplay Systems, State Machines, AI Behaviors, UI Systems

Tools: Git, Debugging/Profiling, Performance Optimization

Experience

Snap Inc. | Software Engineering Intern | UX Platform | Santa Monica, CA June 2025 - August 2025

- Designed and implemented a performant, user-facing search system, applying low-latency data handling and responsive UI patterns **relevant to real-time gameplay systems**.
- **Restructured legacy native** modules to interface with Snap's internal TypeScript framework, partnering with senior engineers to ensure a seamless migration for the settings search feature.
- Validated feature performance through live **A/B testing**, collaborating with designers to refine usability and ensure the search functionality met production-grade standards.

Snap Inc. | Software Engineering Academy Scholar | Santa Monica, CA June 2024 - August 2024

- Selected as **1 of 60** scholars (with a **6%** acceptance rate) for the Snap Engineering Academy, focusing on full stack programming with HTML, CSS, JavaScript, and React to develop web and mobile applications.
- Collaborated with a **cross-functional team** to develop Give Fund, a mobile feature aimed at helping foster youth nonprofits raise funds. Led the programming efforts by building animations, chats and notifications, constructing the profile section page, and contributing to the backend database architecture. Successfully pitched the project to **8** executives and an audience of **250+** members during the final showcase.

Projects

[The Last of Us: The Last Stand](#) | Godot, GDScript, Python

- Engineered a tactical battle architecture and asynchronous loading system, implementing a root-and-branch pre-fetching strategy and texture cache that **reduced frame spikes from 660ms to 35ms** ensuring smooth gameplay during high-intensity encounters.
- Developed a **Python-based data balancing pipeline** analyzing **2,000+ player interactions**, using standard deviation of synergy gain to identify unstable card combinations and rebalance extreme scaling, resulting in more consistent gameplay and clearer strategic decision-making.
- Architected a persistent save system and backend data-logging infrastructure to support **high-scale feature updates**, including a responsive, mobile-optimized UI and an onboarding tutorial.

[The Last of Us: Between the Years](#) | GB Studio, GBVM

- Designed and implemented **modular gameplay systems** in GB Studio, including combat, inventory, and upgrade mechanics, using **object-oriented patterns** to manage weapons, consumables, and player state.
- Engineered event-driven logic to **simulate real-time interactions** (e.g., timed reloads, healing, and input handling) within a constrained visual scripting environment, improving responsiveness and player agency.
- Reached over **8,600** views and **2,000** downloads on itch.io, demonstrating strong player engagement driven by core gameplay systems.

[CPU City](#) | Unity, C#, Git, Visual Studio

- Designed and implemented core gameplay systems in Unity, including dialogue, interaction, and quest progression, integrating player input, camera control, and UI to support **narrative-driven gameplay**.
- Built a state-driven quest and timing system managing progression, fail conditions, and scene transitions, **reinforcing player decision-making** and pacing within the game loop.

Education

Bachelor of Science in Computer Science | University of London, Goldsmiths

Associate of Science in Game Design and Development | Pasadena City College
